

## **SFF-TA-1002**

Specification for

# **Protocol Agnostic Multi-Lane High Speed Connector**

Rev 1.5.2 April 4, 2025

SECRETARIAT: SFF TWG

This specification is made available for public review at <a href="https://www.snia.org/sff/specifications">https://www.snia.org/sff/specifications</a>. Comments may be submitted at <a href="https://www.snia.org/feedback">https://www.snia.org/feedback</a>. Comments received will be considered for inclusion in future revisions of this specification.

This document has been released by SNIA. The SFF TWG believes that the ideas, methodologies, and technologies described in this document are technically accurate and are appropriate for widespread distribution.

The description of a connector in this specification does not assure that the specific component is available from connector suppliers. If such a connector is supplied, it should comply with this specification to achieve interoperability between suppliers.

ABSTRACT:

This specification defines an unshielded, Input/Output, card edge connector and mating card interface capable of operation up to 112GT/s PAM4. The connector has 56, 84, or 140 contacts based on bandwidth needs and is configurable for straight, right angle, straddle mount, and orthogonal applications.

POINTS OF CONTACT:

SNIA Technical Council Managing Director

Email: TCMD@snia.org

Chairman SFF TWG

Email: SFF-Chair@snia.org

**EDITORS:** 

Anthony Constantine, Micron Technology

#### **Intellectual Property**

The user's attention is called to the possibility that implementation of this specification may require use of an invention covered by patent rights. By distribution of this specification, no position is taken with respect to the validity of a claim or claims or of any patent rights in connection therewith.

This specification is covered by the SNIA IP Policy and as a result goes through a request for disclosure when it is published.

The SNIA IP Review Process is still in progress and is completing on xx/xx/xxxx. If IP disclosures that affect this specification are made during this process, this specification may be withdrawn.

Additional information can be found at the following locations:

- Results of IP Disclosures: <a href="https://www.snia.org/sffdisclosures">https://www.snia.org/sffdisclosures</a>
- SNIA IP Policy: https://www.snia.org/ippolicy

#### Copyright

SNIA hereby grants permission for individuals to use this document for personal use only, and for corporations and other business entities to use this document for internal use only (including internal copying, distribution, and display) provided that:

- 1. Any text, diagram, chart, table or definition reproduced shall be reproduced in its entirety with no alteration, and,
- 2. Any document, printed or electronic, in which material from this document (or any portion hereof) is reproduced shall acknowledge the SNIA copyright on that material, and shall credit SNIA for granting permission for its reuse.

Other than as explicitly provided above, there may be no commercial use of this document, or sale of any part, or this entire document, or distribution of this document to third parties. All rights not explicitly granted are expressly reserved to SNIA.

Permission to use this document for purposes other than those enumerated (Exception) above may be requested by e-mailing <a href="mailto:copyright\_request@snia.org">copyright\_request@snia.org</a>. Please include the identity of the requesting individual and/or company and a brief description of the purpose, nature, and scope of the requested use. Permission for the Exception shall not be unreasonably withheld. It can be assumed permission is granted if the Exception request is not acknowledged within ten (10) business days of SNIA's receipt. Any denial of permission for the Exception shall include an explanation of such refusal.

#### **Disclaimer**

The information contained in this publication is subject to change without notice. SNIA makes no warranty of any kind with regard to this specification, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose. SNIA shall not be liable for errors contained herein or for incidental or consequential damages in connection with the furnishing, performance, or use of this specification.

Suggestions for revisions should be directed to <a href="https://www.snia.org/feedback/">https://www.snia.org/feedback/</a>.

#### Foreword

The development work on this specification was done by the SNIA SFF TWG, an industry group. Since its formation as the SFF Committee in August 1990, as well as since SFF's transition to SNIA in 2016, the membership has included a mix of companies which are leaders across the industry.

For those who wish to participate in the activities of the SFF TWG, the signup for membership can be found at <a href="https://www.snia.org/join">https://www.snia.org/join</a>.

#### **Revision History**

Rev 1.0 (December 2017)

Initial release

Rev 1.0a (June 14, 2018)

Corrected header error

Rev 1.0b (June 19, 2018)

- Corrected date error on title page
- Updated Intellectual Property Statement and Foreword to match new template

Rev 1.1 (January 2018)

- Intermediate draft revision

Rev 1.2 (April 3, 2019)

- Added the following connector variations
  - Straight 4C+ variation
  - o Right angle height variation of 4.05mm and 4C+ variations
  - Straddle mount connector variations for 1C, 2C, 4C, 4C+ variations and respective SI requirements
  - Press fit and SMT orthogonal 1C & 2C variations
- Added clarification on differential pair counts in Section 3
- Clarified impedance requirements in Section 5.3
- Added Section 5.5 for manufacturability common requirements
- Relaxed insertion and un-mating force requirements.
- Added Section 6 to define pin geometry placement requirements
- Corrected minor drawing errors and editorials

Rev 1.3 (February 19, 2020)

- Updated Table 5-8 LLCR, Shock, and Vibration test requirements
- Added references to SI test specifications

Rev 1.4 (May 9, 2023)

- Updated to new template.
- Updated Figures 5-40 and 5-41 pin tolerance and added solder mask note
- Added 32GT/s NRZ signal integrity requirements to Table 6-6
- Updated Table A-1
- Editorial update to caption for Figure 4-1
- Added Appendix E
- Added additional Host PCB thickness and offset to Table 5-2.
- Clarified Mechanical shock requirement in Table 6-10.
- Additional editorial fixes

Rev 1.5 (April 29, 2024)

- Modified Test Reliability sequence in Table 6-9
- Added new Table 6-7 to signal integrity requirements for straight, right-angle, and straddle mount PCIe applications up to 64GT/s PAM4. Added iRL and ccICN values. Other tables renumbered.
- Added additional Host PCB thickness (2.55mm) and offset to Table 5-2.
- Changed Host PCB thickness tolerance for 3.05mm in Table 5-2.
- Replaced vertical with straight for document consistency.
- Defined Type 1 (original) and Type 2 (ground tied) connectors with changes in Section 4 and 7.

Rev 1.5.1 (February 28, 2025)

- Changes to boiler plate language per GOV-TA-0004 and made font change.
- Clarifications made for Type 1 and Type 2 connectors in Section 4

- Change to Figure 5-32 to show the 2 different height options for the orthogonal connector
- Errata change to iRL weighting function in Equation 6-1 Note 3
- Added new table and figure and updated Table 6-4 within Section 6.2 to support burst currents.
- Add figures in Section 7 to show label locations
- Minor editorial throughout

### Rev 1.5.2 (April 4, 2025)

- Changed Figure 5-35 to clarify card edge thickness requirement.
- Editorials per comment resolution.

## 1. Scope

This specification defines the mechanical and connector performance requirements for a card edge connector system. This connector system is designed to support high speed signals, power, and side bands on different contacts within the same housing.

### 1.1 Application Specific Criteria

This connector is capable of supporting a range of protocols. This specification does not list specific supported protocols, but instead details the supported signaling rates and the signal integrity requirements met by the connector. The connector supports signaling rates from 2.5 GT/s NRZ to 112 GT/s PAM4. This includes but is not limited to 16, 28, 32, and 56 GT/s NRZ, and 56, 64, and 112 GT/s PAM4. Only the orthogonal version of the connector is limited to signaling rates from 2.5 GT/s NRZ to 32 GT/s NRZ.

#### 2.3 Conventions

The following conventions are used throughout this document:

**DEFINITIONS:** Certain words and terms used in this standard have a specific meaning beyond the normal English meaning. These words and terms are defined either in the definitions or in the text where they first appear.

**ORDER OF PRECEDENCE:** If a conflict arises between text, tables, or figures, the order of precedence to resolve the conflicts is text; then tables; and finally figures. Not all tables or figures are fully described in the text. Tables show data format and values.

**LISTS:** Lists sequenced by lowercase or uppercase letters show no ordering relationship between the listed items.

EXAMPLE 1 - The following list shows no relationship between the named items:

- a. red (i.e., one of the following colors):
  - A. crimson; or
  - B. pink;
- b. blue; or
- c. green.

Lists sequenced by numbers show an ordering relationship between the listed items.

EXAMPLE 2 -The following list shows an ordered relationship between the named items:

- 1. top:
- 2. middle; and
- 3. bottom.

Lists are associated with an introductory paragraph or phrase and are numbered relative to that paragraph or phrase (i.e., all lists begin with an a. or 1. entry).

**DIMENSIONING CONVENTIONS:** The dimensioning conventions are described in ASME-Y14.5, Geometric Dimensioning and Tolerancing. All dimensions are in millimeters, which are the controlling dimensional units (if inches are supplied, they are for guidance only).

**NUMBERING CONVENTIONS:** The ISO convention of numbering is used (i.e., the thousands and higher multiples are separated by a space and a period is used as the decimal point). This is equivalent to the English/American convention of a comma and a period.

American	French	ISO
0.6	0,6	0.6
1,000	1 000	1 000
1.323.462.9	1 323 462.9	1 323 462.9

## 3. Keywords, Acronyms, and Definitions

For the purposes of this document, the following keywords, acronyms, and definitions apply.

### 3.1 Keywords

**May:** Indicates flexibility of choice with no implied preference.

**May or may not:** Indicates flexibility of choice with no implied preference.

**Obsolete:** Indicates that an item was defined in prior specifications but has been removed from this specification.

**Optional:** Describes features which are not required by the SFF specification. However, if any feature defined by the SFF specification is implemented, it shall be done in the same way as defined by the specification. Describing a feature as optional in the text is done to assist the reader.

**Prohibited:** Describes a feature, function, or coded value that is defined in a referenced specification to which this SFF specification makes a reference, where the use of said feature, function, or coded value is not allowed for implementations of this specification.

**Reserved:** Defines the signal on a connector contact when its actual function is set aside for future standardization. It is not available for vendor specific use. Where this term is used for bits, bytes, fields, and code values; the bits, bytes, fields, and code values are set aside for future standardization. The default value shall be zero. The originator is required to define a Reserved field or bit as zero, but the receiver should not check Reserved fields or bits for zero.

**Restricted:** Refers to features, bits, bytes, words, and fields that are set aside for other standardization purposes (e.g., entities). If the context of the specification applies the restricted designation, then the restricted bit, byte, word, or field shall be treated as a reserved bit, byte, word, or field (e.g., a restricted byte uses the same value as defined for a reserved byte).

**Shall:** Indicates a mandatory requirement. Designers are required to implement all such mandatory requirements to ensure interoperability with other products that conform to this specification.

**Should:** Indicates flexibility of choice with a strongly preferred alternative.

**Vendor specific:** Indicates something (e.g., a bit, field, code value) that is not defined by this specification. Specification of the referenced item is determined by the manufacturer and may be used differently in various implementations.

## 3.2 Acronyms and Abbreviations

AIC: Add in Card

GT/s: Giga Transfers per Second

NRZ: Non-Return-to-Zero

PAM4: Pulse Amplitude Modulation 4-level

PCB: Printed Circuit Board

**SMT:** Surface Mount Technology

### 3.3 Definitions

**Advanced grounding contacts:** Connector contacts that make first and break last and are capable of carrying power ground return currents and performing electrostatic discharge. Other terms sometimes used to describe these features are: grounding pins, ESD contacts, grounding contacts, static drain, and pre-grounding contacts.

**Add in card (AIC):** The free half of the connector mating interface defined by this specification. The AIC typically includes more functionality than the physical mechanical interface.

**Asymmetric (transmission):** Bi-directional interface where the maximum rate of transfer for each direction may be independently specified.

**Alignment guides:** A term used to describe features that pre-align the two halves of a connector interface before electrical contact is established. Other common terms include: guide pins, guideposts, blind mating features, mating features, alignment features, and mating guides.

**Basic (dimension):** The theoretical exact size, profile, orientation, or location of a feature. It is used as the basis from which permissible variations are established by tolerances in notes or in feature control frames (GD&T).

**Board Termination Technologies:** Surface mount single row, surface mount dual row, through hole, hybrid, straddle mount, press fit.

**Chiclet:** A building block for use in naming convention defined as 8 differential pairs of data signals.

**Connector:** Each half of an interface that, when joined together, establish electrical contact and mechanical retention between two components. In this specification, the term connector does not apply to any specific gender; it is used to describe the receptacle, the plug or the card edge, or the union of receptacle to plug or card edge. Other common terms include: connector interface, mating interface, and separable interface.

**Contact mating sequence:** Order of electrical contact during mating/unmating process. Other terms sometimes used to describe this feature are: contact sequencing, contact positioning, make first/break last, EMLB (early make late break) staggered contacts, and long pin / short pin.

**Datum:** A point, line, plane, etc. assumed to be exact for the purposes of computation or reference, as established from actual features, and from which the location or geometric relationship of either feature is established.

**Discrete pin connector:** Connector where no pins are bussed together.

**Fixed:** Used to describe the gender of the mating side of the connector that accepts its mate upon mating. This gender is frequently, but not always, associated with the common terminology "receptacle". Other terms commonly used are "female" and "socket connector". The term "fixed" is adopted from EIA standard terminology as the gender that most commonly exists on the fixed end of a connection, for example, on the board or bulkhead side. In this specification "fixed" is specifically used to describe the mating side gender illustrated in Figure 2-1.

**Fixed Board:** A connector that uses a fixed gender mating side and a termination side suitable for any of the printed circuit board termination technologies.

**Free:** Used to describe the gender of the mating side of the connector that penetrates its mate upon mating. This gender is frequently, but not always, associated with the common terminology "plug". Other terms commonly used are "male" and "pin connector". The term "free" is adopted from EIA standard terminology as the gender that most commonly exists on the free end of a connection, for example, on the cable side. In this specification "free" is specifically used to describe the mating side gender illustrated in Figure 2-1.

**Free Board:** A connector that uses a free gender mating side and a termination side suitable for any of the printed circuit board termination technologies

**Height:** Distance from board surface to farthest overall connector feature

**nC:** Connector naming (1C, 2C, 4C) convention that indicates the number of Chiclets. This convention is used because common naming such as "x4, x8" etc. implies symmetrical data transfer in each direction.

**Offset:** An alignment shift from the center line of the connector

**Optional:** This term describes features which are not required by the SFF Specification. However, if any feature defined by the SFF Specification is implemented, it shall be done in the same way as defined by the Specification. Describing a feature as optional in the text is done to assist the reader. If there is a conflict between text and tables on a feature described as optional, the table shall be accepted as being correct.

**Orthogonal:** A connector design for use with printed circuit board assembly technology where the mating direction is parallel to the plane of the printed circuit board while the drive is perpendicular to it.

**Plug:** A term used to describe the connector that contains the penetrating contacts of the connector interface as shown in Figure 3-1. Plugs typically contain stationary contacts. Other common terms include male, pin connector, and card edge.

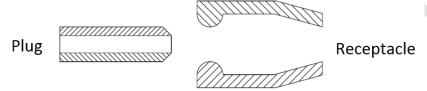

FIGURE 3-1. PLUG AND RECEPTICLE DEFINITION

**Press fit:** A term used to describe a termination style in which collapsible pins penetrate the surface of a PCB. Upon insertion, the pins collapse to fit inside the PCB's plated through holes. The connector or cage is held in place by the interference fit between the collapsed pins and the PCB.

**Reference (dimension):** A dimension provided for information or convenience. It has no tolerance and is not to be used for inspection or conformance. It can be calculated from other tolerance dimensions or can be found elsewhere on the drawing with a tolerance. If removed, it would have no impact on the defined object or the ability or reproduce it.

**Right Angle:** A connector design for use with printed circuit board assembly technology where the mating direction is parallel to the plane of the printed circuit board

**Single row:** A connector design for use with surface mount printed circuit board assembly technology where the termination side points are arranged in one line

**Straddle mount:** A connector design style and a printed circuit board design style that uses surface mount termination points on both sides of the board. The connector is frequently centered between the top and bottom surfaces of the board.

**Straight:** A connector design for use with printed circuit board assembly technology where the mating direction is perpendicular to the plane of the printed circuit board

**Surface mount:** A connector design and a printed circuit board design style where the connector termination points do not penetrate the printed circuit board and are subsequently soldered to the printed circuit board

**Through hole:** A connector design and a printed circuit board design style where the connector termination points penetrates the printed circuit board and are subsequently soldered to the printed circuit board.

**Wipe (Contact Location):** The contact location has two components: direction of mating and direction of contact pitch. In the direction of mating, the Free contact location shall be a minimum of 0.05 mm from either end of the Fixed contact mating interface after mating and latching.

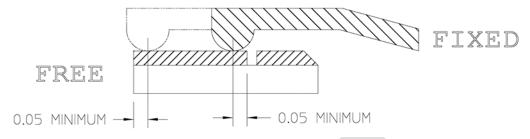

FIGURE 3-2. DIRECTION OF MATING

In the direction of contact pitch, the Free contact shall have no less than 50% of the available mating width in contact with the Fixed contact and there shall be a minimum clearance to the adjacent Fixed contact. The minimum clearance to the adjacent Fixed contact shall be 0.075 mm for interfaces with a pitch of at least 0.70 mm. For pitches less than 0.70 mm, the minimum clearance should be reviewed on a case by case basis to insure that a shorting condition does not exist.

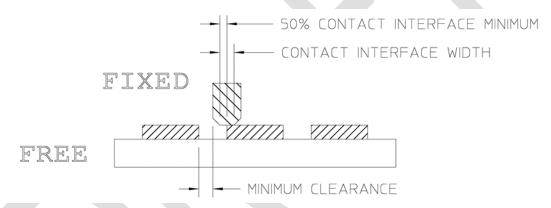

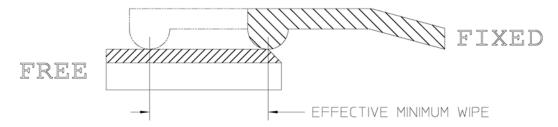

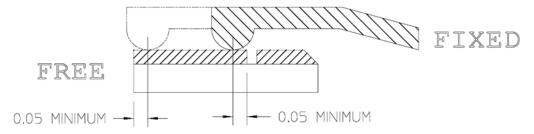

FIGURE 3-3. DIRECTION OF CONTACT

**Wipe (Minimum Effective Contact):** The distance that the Free contact moves along the Fixed contact without losing electrical connection.

**FIGURE 3-4. CONTINUOUS CONTACT** 

A split or interrupted contact surface (i.e. a contact interface with a pre-pad) is allowable so long as the gap does not allow for the Free contact to make contact with a non-conductive surface.

**FIGURE 3-5. SPLIT CONTACT** 

The minimum effective wipe is dependent on the finish of the contact interface. Tin-Tin interfaces shall have a minimum effective wipe of 2.00 mm. Gold-Gold interfaces shall have a minimum effective wipe of 0.40 mm.

## 4. General Description

This specification defines a card edge connector and add in card interface. Refer to SFF-TA-1020 for cable application details. This connector is deployable in a variety of applications and maintains interoperability between cards of different sizes. The connector supports signaling rates from 2.5 GT/s NRZ to 112 GT/s PAM4. This includes but is not limited to 16, 28, 32, and 56 GT/s NRZ, and 56, 64, and 112 GT/s PAM4. Only the orthogonal version of the connector is limited to signaling rates from 2.5 GT/s NRZ to 32 GT/s NRZ.

This specification describes four different connector orientations, straight, right angle, orthogonal and straddle mount, and four connector sizes as follows.

- 1. 1C Connector: A connector with 56 contacts with up to 18 differential pairs of data signals in a GSSGSSG configuration.
- 2. 2C Connector: A connector with 84 contacts with up to 26 differential pairs of data signals in a GSSGSSG configuration.
- 3. 4C Connector: A connector with 140 contacts with up to 44 differential pairs of data signals in a GSSGSSG configuration as defined in.
- 4. 4C+ Connector: A connector with 168 contacts with up to 52 differential pairs of data signals in a GSSGSSG.

In addition to differential pairs of data signals, each connector provides a number of contacts to supply power and management signals. To balance connector flexibility with higher signaling rates, the following connector types are defined.

Type 1: The connector uses a discrete pin interface that allows repurposing for other applications and supports asymmetric transmission. The connector supports repurposing of power and management pins for high speed differential pairs in a GSSGSSG configuration and vice versa. The orthogonal connector orientation does not support Type 1.

Type 2: The connector uses a mix of defined high speed data signals in a GSSGSSG configuration, power, and management signals. In this connector type, the defined grounds may be joined together within the connector.

Connector type 2 shall be clearly labeled on the connector that it is a Type 2 connector with "T2". Connector type 1 may be labeled on the connector with "T1". See Section 7 for the pin geometry pattern for each type as well as location of the label.

2C, 4C, and 4C+ connectors provide keys to provide fine alignment and prevent 180 degree insertion. 1C connectors use the internal side walls of the connector for fine alignment and are keyed by the form factor and host. Refer to specific application specifications for pin functions and assignments. For a reference list of applications and pin assignments in the industry refer to REF-TA-1012: Pin Assignment Reference for SFF-TA-1002 Connectors.

Figure 4-1 represents a typical mating configuration of this connector. Figure 4-3 show the three connector sizes

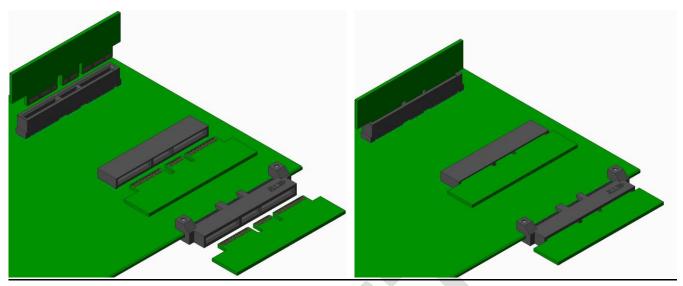

FIGURE 4-1. TYPICAL MATING CONFIGURATION FOR STRAIGHT AND RIGHT ANGLE CONNECTORS

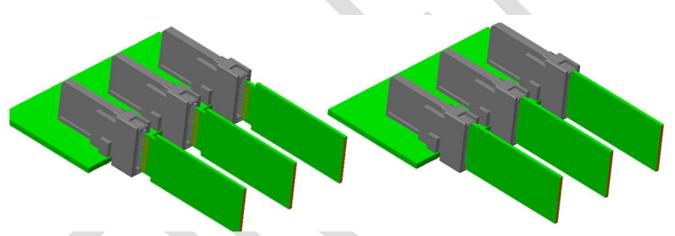

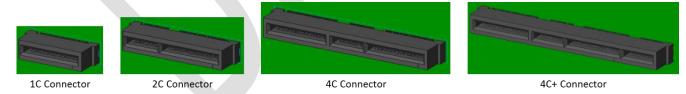

FIGURE 4-2. TYPICAL MATING CONFIGURATION FOR ORTHOGONAL CONNECTORS

**FIGURE 4-3. CONNECTOR SIZES** 

The connector allows complete upward and downward interoperability as follows and as indicated in Table 4-1 and shown in Figure 4-4 and Figure 4-5:

This specification defines the contact range that the retention scheme must provide to assure acceptable connector performance.

### 5. Connector Interface Dimensions

### **5.1** General Requirements

All dimensional requirements for the connector and mating card within this specification shall be met in order to provide interoperability between connector and add in card and to fit within the physical boundaries required by the host.

### 5.2 General Tolerances

Unless otherwise shown, the following tolerances shall apply to the figures:

- a. Two-Place dimension =  $\pm$  0.20mm
- b. Angular dimension =  $\pm$  3 degrees

### **5.3 Unshielded Fixed (Receptacle) Connectors**

# 6. Performance Requirements

## **6.1** Mechanical Testing and Performance

The connector shall meet the mechanical testing requirements shown in Table 6-1.

**TABLE 6-1. MECHANICAL TESTING REQUIREMENTS** 

Mechanical Test Description	Procedure	Requirement
EIA-364-13 Axial Tension/Compression machi as an Instron Tensile Tester. Rate Insertion Force (AIC to Connector)  Connector)  EIA-364-13 Axial Tension/Compression machi as an Instron Tensile Tester. Rate 25.4 mm/min. A gauge or AIC manufactured to the maximum the shall be used for testing purposes		1.1 N/pin pair Maximum
Unmating Force (AIC to Connector)	EIA-364-13 Axial Tension/Compression machine such as an Instron Tensile Tester. Rate: 25.4 mm/min. A gauge or AIC manufactured to the minimum thickness shall be used for testing purposes.	0.10 N/pin pair Minimum
Torrette of France	EIA-364-05 Axial Tension/Compression machine such as an Instron Tensile Tester.	SMT: 0-3 N maximum to enable pick and place Press fit: 27 N/pin maximum
Retention Force	EIA-364-05 Axial Tension/Compression machine such as an Instron Tensile Tester.	2 N/pin minimum to remove
Durability	EIA-364-09 Use appropriate AIC. Perform required cycles for connector grade required per the table below. Plug and unplug cycles at a rate of 25.4 mm/minute, replace mating card after 25 cycles	LLCR: Refer to Table 6-10for LLCR requirements. Note: This specification intentionally deviates from EIA-364- 09 procedure

**TABLE 6-2. MATING CYCLES BY CONNECTOR GRADE** 

Connector Grade	Total Cycles
А	200
В	100
С	50

Note: To enable high durability cycles, a metal alignment key may be implemented in the connector body.

### **6.2 Electrical Testing and Performance**

Devices using this connector may support transient currents that exceed the specified maximum static current of the connector provided the RMS current (the amplitude and duration of the current along with the current before and after the transient) stays below the maximum static current allowed by the connector. The allowable current transients are specified in Table 6-3 and shown in Figure 6-1. Refer to Table 6-4 for connector electrical ratings and Table 6-5 for electrical test requirements and procedures.

TABLE 6-3. CONNECTOR ELECTRICAL CURRENT TRANSIENT SUPPORT.

Current Transient Duration "T"	Peak Transient Current
T ≤ 100 microseconds	3 A
100 microseconds < T ≤ 1 second	(3.948 - 0.206 x In(T)) A
T > 1 second	1.1 A <sup>1</sup>

#### Notes:

1. This is the static current supported by the connector.

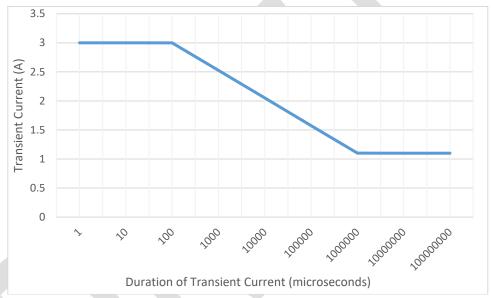

FIGURE 6-1. CONNECTOR ELECTRICAL CURRENT TRANSIENT SUPPORT.

Insulation resistance	1,000 M $\Omega$ minimum.	EIA 364-21 After 100 VDC for 1 minute, measure the insulation resistance between the adjacent contacts of unmated connector assemblies.		

### **6.3 Signal Integrity Testing and Requirements**

The connector shall meet the Signal Integrity requirements for all line rates specified in Table 6-6, Table 6-7, and Table 6-8. This specification does not restrict, require or define a specific impedance for the connector. The electrical requirements contained in Table 6-6, Table 6-7, and Table 6-8 are normalized to an 85 Ohm differential simulated or measured environment. Refer to SFF-TA-1017 for test fixture specifications to measure straight connectors. Refer to SFF-TA-1018 for test fixture specifications to measure right angle connectors. Refer to SFF-TA-1019 for test fixture specifications to measure straddle mount connectors.

TABLE 6-6. STRAIGHT, RIGHT ANGLE AND STRADDLE MOUNT CONNECTOR SIGNAL INTEGRITY REQUIREMENTS (NON PCIE APPLICATIONS)

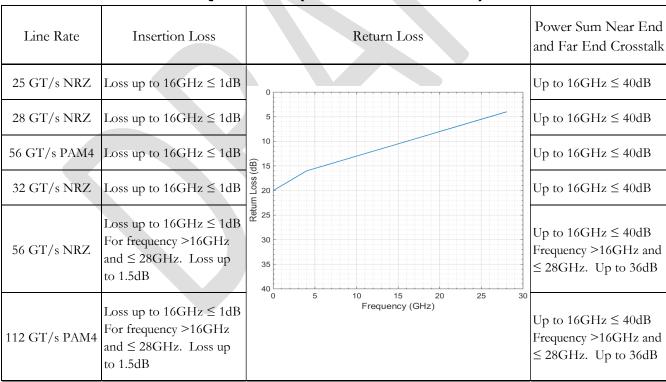

TABLE 6-7. STRAIGHT, RIGHT ANGLE AND STRADDLE MOUNT CONNECTOR SIGNAL INTEGRITY
REQUIREMENTS (PCIe APPLICATIONS)

Line Rate	Insertion Loss	Return Loss	Power Sum Near End Crosstalk	Power Sum Far End Crosstalk	Intrapair Skew
8 GT/s NRZ (PCIe 3.0)		See 32GT/s NR	Z values from Table 6	-6	
16 GT/s NRZ (PCIe 4.0)		See 32GT/s NR	Z values from Table 6	-6	
32 GT/s NRZ (PCIe 5.0)		See 32GT/s NR	Z values from Table 6	-6	
	≥(-0.1–0.040625*f)dB (0.01≤f≤16 GHz)	≤(-25+0.625*f)dB (0.01≤f≤24 GHz)	≤(-65+0.625*f)dB (0.01≤f≤24 GHz)	≤(-70+3.75*f)dB (0.01≤f≤4 GHz)	≤0.2 ps <sup>5</sup>
64 GT/s PAM4	≥(1.75-0.15625*f)dB (16 <f≤24 ghz)<="" td=""><td>iRL<sup>1,4</sup> ≤ -28 dB</td><td><math>CCICN_{NEXT}^2 \le 149uV</math></td><td>≤(-58+0.75*f)dB (4≤f≤24 GHz)</td><td></td></f≤24>	iRL <sup>1,4</sup> ≤ -28 dB	$CCICN_{NEXT}^2 \le 149uV$	≤(-58+0.75*f)dB (4≤f≤24 GHz)	
(PCIe 6.0)				Straight: ccICN <sub>FEXT</sub> <sup>3</sup> ≤ 110uV	
				Right Angle and Straddle mount: ccICN <sub>FEXT</sub> <sup>3</sup> ≤ 125uV	

#### Notes:

- 2. Integrated Return Loss (iRL) is an excursion allowance that should only be measured if the Return Loss spec is violated. If Return Loss passes then no iRL measurement is needed. If Return Loss fails but iRL passes then Return Loss is considered passing. See Equation 6-1 for how to calculate iRL.
- 3. ccICN<sub>NEXT</sub> is an excursion allowance that should only be measured if the Power Sum Near End Crosstalk spec fails. If Power Sum Near End Crosstalk passes then no ccICN<sub>NEXT</sub> measurement is needed. If Power Sum Near End Crosstalk fails but ccICN<sub>NEXT</sub> passes then Power Sum Near End Crosstalk is considered passing. See Equation 6-2 for how to calculate ccICN<sub>NEXT</sub>.
- 4. ccICN<sub>FEXT</sub> is an excursion allowance that should only be measured if the Power Sum Far End Crosstalk spec fails. If Power Sum Far End Crosstalk passes then no ccICN<sub>FEXT</sub> measurement is needed. If Power Sum Far End Crosstalk fails but ccICN<sub>FEXT</sub> passes then Power Sum Far End Crosstalk is considered passing. See Equation 6-3 for how to calculate ccICN<sub>FEXT</sub>. Excursions of PSFEXT shall not deviate PSFEXT by more than 4db with a frequency span less than 2 GHz.
- 5. Nyquist frequency: 16 GHz for PCIe 6.0
- 6. Measurement not required. Evaluated through simulation using EIPS method documented in Appendix E.

#### **EQUATION 6-1. INTEGRATED RETURN LOSS (IRL) CALCULATION**

$$iRL = dB\left(\sqrt{\frac{1}{N}\sum_{i=1}^{N}W(f_i)RL_{avg}^2(f_i)}\right)$$

- 1.  $RL_{avg}(fi) = (|RL_{11}(fi)| + |RL_{22}(fi)|)/2$
- 2.  $RL_{11}(f)$ ,  $RL_{22}(f)$  = connector return loss
- 3. Weighting Function W(fi) =  $sinc^2 \left(\frac{f_i}{f_b}\right) \left(\frac{1}{1 + \left(\frac{f_i}{f_c}\right)^4}\right) \left(\frac{1}{1 + \left(\frac{f_i}{f_c}\right)^8}\right)$
- 4.  $f_b = 32 \text{ GHz for PCIe } 6.0$
- 5.  $f_t = 9.46$  GHz, (where  $f_t = \frac{0.2365}{T_T}$ ; rise time ( $T_r$ )=25ps)
- 6.  $f_r = 1.5 \times \text{Nyquist frequency}$
- 7. N = Number of samples, length of frequency array, in 10 MHz steps)

### **EQUATION 6-2. COMPONENT CONTRIBUTED INTEGRATED CROSSTALK NOISE FOR NEAR END** CROSSTALK (CCICNNEXT) CALCULATION

$$ccICN_{NEXT} = \sqrt{\frac{1}{2} df \sum_{k=1}^{Nmax} \sigma_x^2 (\frac{A_{NT}^2}{f_b}) sinc^2 (k * \frac{df}{f_b}) 10^{(2\frac{IL_{post-channel}(k)}{10})} \left[ \frac{1}{1 + (\frac{k * df}{f_t})^4} \right] \left[ \frac{1}{1 + (\frac{k * df}{f_r})^8} \right] 10^{\frac{MDNEXT(k)}{10}}$$

- 1.  $IL_{post-channel} = -6dB$  @ Nyquist frequency,  $IL_{post-channel}(f) = -(\frac{6}{f_B/2})f$
- 2. Frequency sweep for function = 0.01 GHz to 1.5\*Nyquist in 0.01 GHz steps (e.g., k = 0.01 GHz, Nmax = 2400 for PCIe 6.0)
- 3.  $A_{NT}$ =1000 mVpp (differential peak to peak voltage)
- 4.  $f_t = 31.53$  GHz,  $f_r = 1.5*$ Nyquist (where  $f_t = 0.2365/$   $T_r$ ;  $T_r = 7.5$ ps) 5.  $\sigma_x^2 =$ scaling factor = 5/9
- 6. sinc function definition in these equations is normalized sinc function  $(\operatorname{sinc}(x) = \sin(\operatorname{pi}*x)/(\operatorname{pi}*x))$
- 7.  $MDNEXT(k) = 10 \log_{10}(\sum_{i=1}^{3} 10^{PSNEXT_i/10})$

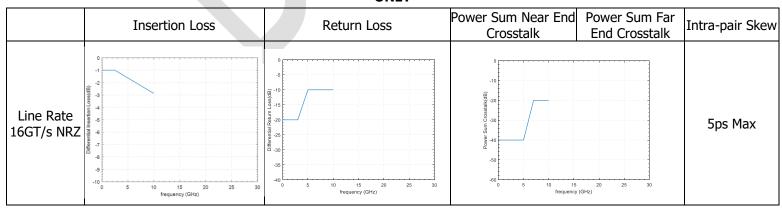

### **EQUATION 6-3. COMPONENT CONTRIBUTED INTEGRATED CROSSTALK NOISE FOR FAR END** CROSSTALK (CCICNFEXT) CALCULATION

 $ccICN_{FEXT}$ 

$$=\sqrt{\frac{1}{2}df\sum_{k=1}^{Nmax}\sigma_{x}^{2}(\frac{A_{FT}^{2}}{f_{b}})sinc^{2}(k*\frac{df}{f_{b}})10^{(\frac{IL_{pre-channel}(k)}{10}+\frac{IL_{post-channel}(k)}{10})}}{\left[\frac{1}{1+(\frac{k*df}{f_{t}})^{4}}\right]\left[\frac{1}{1+(\frac{k*df}{f_{r}})^{8}}\right]10^{\frac{MDFEXT(k)}{10}}}$$

- 1.  $IL_{pre-channel} = -25.25$ dB @ Nyquist,  $IL_{post-channel}(f) = -(\frac{25.25}{f_h/2})f$
- 2.  $IL_{post-channel} = -6dB$  @ Nyquist,  $IL_{post-channel}(f) = -(\frac{6}{f_b/2})f$
- 3. Frequency sweep for function = 0.01 GHz to 1.5\*Nyquist in 0.01 GHz steps (e.g., k = 0.01 GHz, Nmax = 2400 for PCIe 6.0)
- 4.  $A_{FT}$ =800 mVpp (differential peak to peak voltage)
- 5.  $f_t = 31.53$  GHz,  $f_r = 1.5*$ Nyquist (where  $f_t = 0.2365/$   $T_r$ ;  $T_r = 7.5$ ps)
- 6.  $\sigma_x^2$  = scaling factor = 5/9
- 7. sinc function definition in these equations is normalized sinc function (sinc(x) = sin(pi\*x)/(pi\*x))
- 8.  $MDFEXT(k) = 10 \log_{10}(\sum_{i=1}^{2} 10^{PSFEXT_i/10})$

Procedure	EIA 364-101 The measured differential S parameter shall be referenced to an 85Ω differential impedance.	EIA 364-108 The measured differential S parameter shall be referenced to an 85Ω differential impedance.	EIA 364-90 The measured differential S parameter shall be referenced to an 85Ω differential impedance.	EIA 364-90 The measured differential S parameter shall be referenced to an 85Ω differential impedance.	Intra-pair skew shall be achieved through EIPS measurement method documented in Appendix E

## **6.4 Reliability Testing and Requirements**

Table 6-9 shows the testing order required to validate the connectors developed with this specification per five EIA 364-1000 test groups for 3, 5, or 7-year life cycle requirements. Five samples shall be tested per group.

**TABLE 6-9. RELIABILITY TEST SEQUENCE** 

			_		
Took	Test Group				
Test	1	2	3	4	5

	5 Hz @ 0.01 g2/Hz to 20 Hz @ 0.02 g2/Hz (slope	environmental criteria
	up)	
	20 Hz to 500 Hz @ 0.02 g2/Hz (flat) Input	
	acceleration is 3.13 g RMS	
Vibration	10 minutes per axis for all 3 axes on all samples	
	Random control limit tolerance is $\pm 3 \text{ dB}$	
	Shock and Vibration board design should have	
	proper footprint to mate to the connector and test	
	equipment and not produce resonances across the	
	test frequency profile. Further design details are the	
	discretion of the implementer of the test.	
		Electrical, mechanical and
	measurements, cold shock and vibration. Ramp	environmental criteria
	times should be 0.5 hour and dwell times should be	
Humidity	1.0 hour. Dwell times start when the temperature	
	and humidity have stabilized within specified levels,	
	perform 24 cycles in mated condition.  EIA-364-32, Method A, Table 2, Test Condition 1,	Electrical, mechanical and
	-55 °C to 85 °C, perform 5 cycles in mated condition	1
	55 6 to 65 6, perioriti 5 cycles in mateu condition	Cityii Oliii Ciltai Ciltaila
Thermal Shock		

Reliability Test Description	Procedure	Requirement
Thermal Disturbance	EIA-364-1000 Cycle the connector between $15 \pm 3$ °C and $85 \pm 3$ °C, as measured on the part. Ramps should be a minimum of 2 °C/minute. Dwell times should ensure that the contacts reach the temperature extremes (a minimum of 5 minutes), humidity is not controlled; perform 10 cycles in mated condition.	Electrical, mechanical and environmental criteria
Mixed Flowing Gas	EIA-364-65, class IIA, Option 4. Expose all specimens in the mated condition for the total mixed flowing gas exposure duration per Table 4.	Electrical, mechanical and environmental criteria
Reseating	, , , , , ,	No evidence of physical damage

## 6.5 Manufacturability Testing and Requirements

Table 6-9 shows the testing required to validate the connectors developed with this specification meet common manufacturing criteria in the electronics industry. The test details shown here are for reference. It is recommended that the connector body be narrowed above the SMT leads to allow for visual inspection of solder joints.

**TABLE 6-11. RELIABILITY TEST CONDITIONS** 

Manufacturing Test Description	Procedure	Requirement
Solderability - Lead Free	J-STD-002D; Condition C, 8 hours ± 15 minutes steam precondition.	95% coverage minimum
Lead Free Process ability	260 °C, 5 seconds.	No physical damage to connector per visual inspection at 24 inches. No magnification
Electronic Assembly	IPC-7711/7721: Rework, Repair and	Meets Class 2, Highest Level of
Rework, Repair, and	Modification of Electronic Assemblies	Conformance (section 1.5.1)
<b>Modification Procedures</b>		
Electronic Assembly	IPC J-STD-001: Requirements for Soldered	Meets Class 2 Acceptance criteria,
Materials, Methods, and	Electrical and Electronic Assemblies	Dedicated Service Electronic Products
Acceptance Criteria		(section 1.3)

## 7. Pin Geometry Pattern and Connector Labeling

As stated in section 4, the connector supports multiple types depending on whether grounds need to be tied together for improved signal performance. This section shows the different geometry types and the labeling locations for each connector.

## 7.1 Pin Geometry Pattern

The tables below only describe which pins use a "signal" geometry, which pins use a "GND" geometry, and which pins are Power or Control "PWR/CTL", if and only if the geometry of those pins is different and does not define a functional pin out.

Type 1 (T1) connector is defined in

Table 7-1 below. If a connector implementation uses different pin geometry between ground pins and high-speed signal pins, the connector shall follow the GSSGSSG pattern defined.

Type 2 (T2) connector with grounds tied together is defined in Table 7-2 below.

## 7.2 Labeling Connector Types

A human legible label indicating connector type ("T1" or "T2") shall be placed anywhere on the viewing side of the connectors shown below. Figure 7-1 shows the face of the Vertical Connector. Figure 7-2 shows the face of the Right-Angle Connector. Figure 7-3 shows the face of the Straddle Mount Connector.

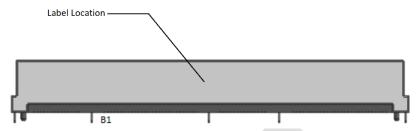

FIGURE 7-1. VERTICAL CONNECTOR LABEL LOCATION

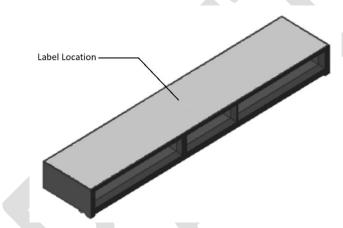

FIGURE 7-2. RIGHT ANGLE CONNECTOR LABEL LOCATION

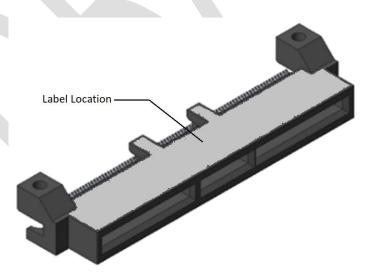

FIGURE 7-3. STRADDLE MOUNT CONNECTOR LABEL LOCATION

# **Appendix A.** Mating Sequence

The connector receptacle has one stage of mating. First mate last break functionality is achieved with the Level 1 and Level 2 Sequencing on the AIC mating pads as indicated in Table A-1. The AIC mating positions below are an example implementation.

## **Appendix B.** Gatherability

Figure B-1 and Figure B-2 show the linear and angular gatherability of the connector. Figure B-3 shows the mechanical keying for the 4C connector.

### **Appendix C. Printed Circuit Board Footprints**

Included PCB layouts are informative to provide a common connector mounting interface to the host board to enable multi-sourcing of the connector while ensuring electrical performance.

This specification is not intended to address the electrical performance characteristics of the host Printed Circuit Board (PCB) material and construction used in these applications. The PCB thickness, number of layers, layer stack up, trace layer location(s), copper plane anti-pads, etc., are all major contributors to the final electrical characteristics of each unique application of the connector. Figure C-1 through Figure C-16 show the recommended PCB footprints.

# **Appendix D.** Connector Solder Lead Geometry

Refer to Table D-1 and Figure D-1 for informative solder lead geometry for the connector.

**TABLE D-1. SMT LEAD GEOMETRY DIMENSIONS** 

Variable	Description	Straight	Right Angle
Α	Pad Width	0.35	0.35
В	Lead Thickness	0.20	0.20
С	Lead Length on Pad	0.76	1.12
	Lead Tip to Footprint	2.75	1.79
D	Centerline		
E	Pad Length	1.20	1.40
	Distance Between Inside	3.40	1.56
F	Edges of Pads		
W	Lead Width	0.24	0.24

### **Appendix E.** Effective Intra-Pair Skew (EIPS)

The effective skew calculation starts from the frequency domain skew, which is captured from the modified mixed-mode insertion loss. The modified mixed-mode insertion loss relates the differential input to the single-ended output while accounting for the coupling within a differential pair properly. The modified mixed-mode insertion loss, S2d1, and S4d1, which relate the differential input to the single-ended outputs within a 4-port system, are depicted in Figure E-1. The intra-pair skew addition mechanism is illustrated in Figure E-2.

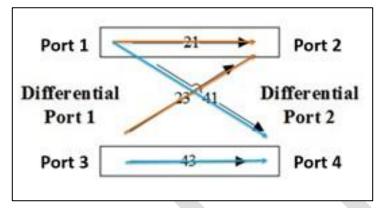

FIGURE E-1. MODIFIED MIXED-MODE INSERTION LOSS, S2D1 AND S4D1

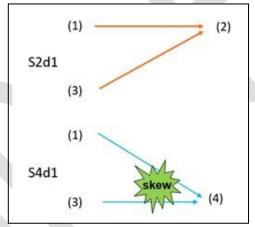

FIGURE E-2. INTRA-PAIR SKEW INTRODUCTION TO A 4-PORT SYSTEM

The modified mixed-mode insertion loss can be represented by the single-ended S-parameter equations as shown in Equation E-1.

#### **EQUATION E-1. CALCULATIONS FOR S2D1 AND S4D1**

$$S2d1 = \frac{1}{\sqrt{2}} \times (S21 - S23)$$
$$S4d1 = \frac{1}{\sqrt{2}} \times (S43 - S41)$$

The frequency domain skew, skew(f) is obtained by calculating the difference between two phase delays as shown in Equation E-2.

#### **EQUATION E-2. CALCULATIONS FOR SKEW**

$$\Delta t_1 = -\frac{unwrap(phase(S2d1))}{2\pi f}$$

$$\Delta t_2 = -\frac{unwrap(phase(S4d1))}{2\pi f}$$

$$skew(f) = \Delta t_1 - \Delta t_2$$

The calculated frequency domain skew is multiplied by a weighting function, which is the product of power spectral density of the random binary sequence and skew impact on the normalized mode conversion. EIPS is the weighted frequency domain skew and is integrated over the frequency region up to  $1.5 \times (\text{Nyquist frequency})$  where  $f_{max}$  is set at  $1.5 \times (\text{Nyquist frequency}, f_N)$  as shown in Equation E-3. Skew<sub>avg</sub> is the mean of the magnitude of the frequency domain skew over the frequency region of  $[f_{min}, f_{max}]$ .  $F_b$  is the baud rate.  $F_r$  is the Rx rise time and  $F_t$  is the TX rise time of a Butterworth filter.

#### **EQUATION E-3. CALCULATIONS FOR EFFECTIVE INTRA-PAIR SKEW**

$$EIPS = \int_{f_{min}}^{f_{max}} W(f) \cdot |skew(f)| df$$

$$W(f) = \frac{\left| db(S_{cd21,avg\ skew}) - db(S_{cd21,0skew}) \right| \times PSD}{\int_{f_{min}}^{f_{max}} \left| db(S_{cd21,avg\ skew}) - db(S_{cd21,0skew}) \right| \times PSD\ df}$$

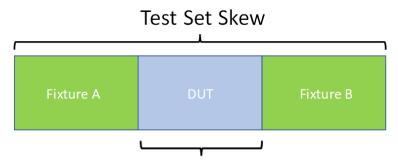

$$S_{cd21,avg\ skew} = \frac{1}{2} \times (S21 - S23 + S41) \times e^{j2\pi f \times (skew(f) - skew_{avg})} - S43 \times e^{j2\pi f \times (skew(f) - skew_{avg})}$$

$$S_{cd21,0\ skew} = \frac{1}{2} \times (S21 - S23 + S41) \times e^{j2\pi f \times skew(f)} - S43 \times e^{j2\pi f \times skew(f)}$$

$$PSD = sinc(\frac{f}{f_b})^2 \times \frac{1}{1 + (\frac{f}{f_r})^8} \times \frac{1}{1 + (\frac{f}{f_t})^4}$$

To test EIPS, the following should be done:

- 1. Test Set (Mated Connector + Fixture) Intra-Pair Skew
  - a. Insert the DUT into test fixtures for the full channel measurement.
  - b. Capture the test set intra-pair skew from IL measurement of each differential pair in the test plan using VNA.
  - c. The test set skew is calculated using the Effective Intra-pair Skew per method described in this section.
- 2. Device Under Test (DUT) Intra-Pair Skew
  - a. Calculate DUT skew by subtracting absolute value of rounded fixture skew from absolute value of the test set skew.
  - b. Round fixture skew to the nearest ps
  - c. Calculate DUT skew by subtracting absolute value of rounded fixture skew from absolute value of the test set skew Figure.

Device Under Test (Component) Effective Intra-pair Skew
